

Lectures' Outlines and Reading Lists

Prof. Santiago RUBIO, University of Valencia, Spain (School Coordinator).

Topic: Dynamic models of international environmental agreements: a differential game approach.

The lecture is organized in three parts covering the following items:

- a) The Basic Model: A Differential Game of International Pollution Control
 - Description of the game
 - The Full-Cooperation
 - The Non-Cooperative Equilibria:
 - The open-loop Nash equilibrium
 - The stationary Markovian Nash equilibrium
- b) Self-Enforcing International Environmental Agreements with a Stock Pollutant and a Fixed Membership
 - The agreement formation game with a fixed membership
 - The open-loop Nash equilibrium of the emission game
 - The stability conditions
- c) Self-Enforcing International Environmental Agreements with a Stock Pollutant and a Variable Membership
 - A difference game of international pollution control: description of the game
 - The agreement formation game with a variable membership
 - The stationary Markovian Nash equilibrium of the emission game
 - Approximating the value function

Prof. Carlo CARRARO, Ca' Foscari University of Venice and Fondazione Eni Enrico Mattei, Italy
Topic: The incentives to participate in and the stability of international climate coalitions: a game-theoretic analysis using the WITCH model

The lecture will be divided in two parts. In the first parts key concepts of cooperative and non-cooperative coalition theory will be introduced. A particular focus will be given to the analysis of key concepts as *profitability, stability, potential environmental effectiveness*. The possibility to make profitable coalitions stable by means of transfers will be carefully examined. In the second part of the lecture the key concepts introduced in the first part will be examined using recent applied work on coalitions profitability, stability and environmental effectiveness with the WITCH model.

Preliminary outline of the lecture:

1. Introduction: Game Theory and Climate Change
2. The Cooperative Approach
3. Non-cooperative Coalition Theory
4. Profitability, Stability and the γ -game
 - a. Profitability and stability as necessary conditions for existence of coalitions
 - b. The γ -game: from characteristic functions to partition functions
5. Environmentally effective coalitions
 - a. The concept of PECs (Potentially effective coalitions)
6. Equilibrium structures and the rules of the game
 - a. Simultaneous games
 - b. Sequential games
 - c. Bargaining on the rules of the game
7. The Enlargement of Coalitions
 - a. Superadditivity
 - b. Coalition rationality
 - c. Commitment
8. Transfers
 - a. Ex-ante transfer schemes
 - b. Ex-post transfer schemes
9. Issue Linkage
10. An applied analysis with the WITCH model
 - a. A game-theoretic introduction to the WITCH model
 - b. An applied analysis of the incentives to participate in and the stability of international climate coalitions

Topic: Drivers of stability of climate coalitions: simulations with the STACO model

This lecture deals with the formation and stability of international climate agreements from an applied perspective. The STACO model is used to project costs and benefits of an international agreement on climate change mitigation activities. First, the key building blocks of the model are described. Essentially, STACO is a hybrid between an Integrated Assessment model that describes how climate change and economic activity are linked and a game-theoretic model that describes the formation and stability of an international climate coalition.

Next, the issue of calibration, that is so important for numerical analysis, is discussed.

The STACO model is then used to investigate which drivers affect the formation and stability of international climate agreements (ICAs). Different financial transfer schemes are compared, and different specifications of the game rules.

Throughout the lecture, the emphasis will be on clearly explaining how applied modellers can specify their modelling framework to provide numerical insights that go beyond the stylized theoretical findings.

Topic: Coalition formation under uncertainty and risk: the success of international environmental agreements.

The two lectures deal with the formation of international climate agreements, considering uncertainty and learning. The lectures comprise three parts. 1) risk neutrality, 2) risk aversion and 3) possible interesting extensions. The lecture notes will be available shortly before the summer school. The reading list comprises a selection of references which may be useful for following the lecture and for further reading. Obviously, choices by students will depend on individual preferences and time constraints. Therefore, I indicate below only a very small selection of references with an asterisk which are immediately related to the lectures, not implying that the other references are not important or not interesting. The indicated papers will be made available in their most recent version.

Prof. Andreas LANGE, University of Maryland, USA

Topic: Equity preferences and the formation of coalitions to provide public goods - experimental evidence from the lab.

This lecture links the problem of forming international agreements to the question of voluntary provision of private goods. Just as countries, individuals have incentives to free-ride on each others provision of the public good. The lecture discusses recent literature on the private provision of public goods and relates this to coalition formation problems. This lecture draws on insights from experimental and behavioral economics. In the first part, we discuss how equity considerations may influence the provision efforts of public goods and the stability of coalitions. In the second part, we discuss findings from experiments that provide a direct test of theories on coalition formation.

Why should you care?

Negotiations frequently involve references to equity and fairness. For example, negotiators in international climate negotiations often refer to relate to the polluter-pays principle, to equal per capita emissions, or to percentage reduction of emissions. Similarly, at the individual level, many experiments have shown that individuals do not necessarily maximize their payoff only, but may take inequality and fairness aspects into account when making their decisions. As a consequence, standard economic theory has been adjusted to account for such behavioral economics insights. It can thereby inform institutional decisions at different levels.

We can therefore study how equity considerations may impact the formation of coalitions, both theoretically and empirically. Furthermore, economic experiments provide a wonderful testing ground for how well existing theories on coalition formation actually succeed in explaining actual behavior.

What should you expect?

The first lecture approaches the role of equity in international negotiations from two different, but related perspectives: (i) based on recent behavioral models, we discuss what effects equity considerations may theoretically have on cooperation, i.e. on the stability of coalitions. (ii) we discuss empirical evidence on the role of equity in international negotiations.

In the second lecture, we discuss experiments that test the theory of coalition formation. We relate this to the very vibrant economic literature on voluntary provision of public goods.

Dr. Leonardo MASSAI, TMC Asser Institute, The Netherlands

Topic: Before and after the Copenhagen Accord: stocktaking pros and cons of the new legal architecture of the climate change regime.

The Copenhagen Summit of 7-18 December 2009 (COP15 and CMP5) gathered together almost 115 Heads of State and government and 40.000 individuals, including representation of academia, the business sector, media, non-governmental organizations (NGOs) and international organizations with the aim to provide legal certainty and political guidance to the future of the international climate regime after 2012 in accordance with the Bali Roadmap.

At the end, the Summit did not conclude the two years negotiation process initiated by the international community in Bali in 2007. Ten official meetings among Parties to the United Nations Framework Convention on Climate Change (UNFCCC) and the Kyoto Protocol were not sufficient to reach a conclusion on the future of the international climate change regime after 2012.

This lecture is aimed at shedding some light on the process, results and follow-up of COP15 and CMP5 from a legal perspective. To this aim, the following issues will be addressed:

- History and development of the negotiations on climate change:
 - Negotiations groups and practices under the UNFCCC
 - Foundations of the post-2012 climate change talks
 - The original sin: Bali Road Map
 - The road to Copenhagen in 2009: Bonn (III), Bangkok and Barcelona
- The Copenhagen Accord:
 - The failure of the UNFCCC process
 - Procedural irregularities
 - Pros and cons
 - Legal aspects and effects
- The future of the UNFCCC after Copenhagen:
 - Voting or consensus?
 - The 'legally binding' question: international treaties, customary law, decisions of international organizations, decision by Conference of the Parties
 - Unresolved issues for COP16 (amendment to the KP and Convention, new Protocol) and beyond
 - Options for the future
